The In-Brief article on delayed-release risedronate in issue 1360 included a statement that alendronate is currently the only bisphosphonate available generically. That would have been accurate if we had added “that is FDA-approved for treatment of osteoporosis.” Etidronate (Didronel, and others), which was the first bisphosphonate used to treat osteoporosis (Medical Letter 1990; 32:111) but was never approved for such use by the FDA, is also available generically. It is approved for treatment of Paget’s disease and for prevention and treatment of heterotropic ossification following hip replacement and in spinal-cord injured patients.
